ScholarRAG Acceptance Study

Authored test document. These are synthetic evaluation values, not claims about real research.

1. Method
A retrieval evaluation uses 120 fixed questions over six documents.
The dense baseline achieves recall@5 of 0.62.
Hybrid retrieval achieves recall@5 of 0.87.
Hybrid retrieval with reranking achieves recall@5 of 0.91.

The comparison uses identical questions and source documents for all three methods.
The aim is to test document ingestion, evidence retrieval and citations.

2. Authorization and Interpretation

Every query is restricted to the selected documents inside the current workspace.
Private notes, collections and conversations belong to their author.
A citation locates source evidence; it does not itself prove semantic support.

3. Results
The absolute gain of hybrid retrieval over the dense baseline is 0.25.
The relative gain is approximately 40.3 percent: (0.87 - 0.62) / 0.62.
Reranking adds a further 0.04 absolute recall@5.
